Are micro-grid solutions viable for the electrification of rural communities?

The techno-economic investigations carried out in the literature show that micro-grid solutions can be technically viable for the electrification of rural communities. Studies have shown that DC, AC or hybrid technologies can be configured such that the load demand in rural areas is served.

What are the different types of micro-grid systems?

The two most common system configurations for rural micro-grids are solar photovoltaics, often paired with batteries; and micro-hydro plants (MHP), with micro wind or biomass-based systems less common (International Renewable Energy Agency, 2019).
