Global solar photovoltaic capacity has grown from around 40 gigawatts in 2010 to approximately 2.2 terawatts in 2024. Only in that last year, installations increased by almost 40 ...

Since the 1950s, when the first solar cells were commercially manufactured, there has been a succession of countries leading the world as the largest producer of electricity from solar photovoltaics.

Solar delivered two-thirds of the new US power capacity in August, marking two years in which it led every month across all energy sources.

Solar power is no longer a niche solution. It's a fast-growing, mainstream energy source reshaping the US power grid. Solar capacity continues to surge from sprawling utility-scale solar ...

Yes, it is still possible that clean energy can power the world by 2050, and if we get there, solar will become the single largest source of electricity globally.

"In our most recent monthly inventory of power plants, developers reported plans to bring 32 GW of solar capacity online in the next 12 months (October 2025 through September 2026)," EIA...

The U.S. is still on track to build a record amount of new solar capacity this year, even as the Trump administration works to obstruct renewables. As it stands, the power industry is building ...

Delays in solar project schedules tend to be relatively short in duration, and reports of delays are more common than cancellations: less than 1% of planned solar capacity is entirely ...

Some data are also included for plants that are either mothballed, retired, or canceled. The tracker further provides national totals for distributed solar capacities for 31 countries/areas.

Now there are still a few solar power plants

All solar segments set annual installation records except for residential solar, which experienced its lowest year of new capacity since 2021. The factors driving installation growth in ...
