Can a photovoltaic virtual synchronous generator withstand environmental changes?

Hua et al. (2017) designed a photovoltaic virtual synchronous generator model, using 10% of the maximum output power of the photovoltaic array as the spinning reserve capacity of distributed generation to provide frequency support. However, the proportion of reserved photovoltaic power is a fixed value and cannot adapt to environmental changes.

Can DC-link voltage control be used for two-stage photovoltaic (PV) power generation?

However, it brings some troubles on DC-link voltage control when it is applied to two-stage photovoltaic (PV) power generation. This study proposes a DC-Side synchronous active power Control for two-stage photovoltaic (PV) power generation without energy storage.

Can a photovoltaic injection system provide voltage and frequency support?

In this paper, a photovoltaic injection system is designed with a virtual synchronous machine control strategy to provide voltage and frequency support to the grid. The maximum power point tracking algorithm is adapted to provide the direct voltage reference and inject active power according to the droop frequency control.

How is power injection controlled in a photovoltaic array?

The power injection control of a photovoltaic array is achieved through a DC voltage control loop. The voltage is determined by the energy stored in the capacitor, defined by the following:
