What is the composition of Earth's atmosphere?

Earth's atmosphere is composed of about 78% nitrogen, 21% oxygen, and one percent other gases. These gases are found in atmospheric layers (troposphere, stratosphere, mesosphere, thermosphere, and exosphere) defined by unique features such as temperature and pressure.

What gases are in Earth's atmosphere?

From largest to smallest, Earth's atmosphere composition contains nitrogen, oxygen, argon, CO₂, and trace gases. Because water vapor is highly variable geographically, it's excluded from this total. 1. Nitrogen (78.1%) While nitrogen is the most abundant gas in Earth's atmosphere, it only makes up 0.005% of Earth's crust in weight (David Darling).

How many gases are in the atmosphere?

The mix of gases in the atmosphere forms a complex system organized into layers that together support life on Earth. Although there are numerous gases, as shown in Table 6.1, the top four gases make up 99.998 % of the volume of clean dry air (unpolluted air that does not contain water vapor).

Why is the atmosphere a layer of gas?

Introduction to the Atmosphere The atmosphere is a layer of gas and suspended solids extending from the Earth's surface up many thousands of miles, becoming increasingly thinner with distance but always held by the Earth's gravitational pull.

The atmosphere surrounds the Earth and holds the air we breathe; it protects us from outer space; and holds moisture (clouds), gases, and tiny particles. In short, the atmosphere is the ...

One of the main components of Earth's interdependent physical systems is the atmosphere. An atmosphere is made of the layers of gases surrounding a planet or other celestial body. Earth's ...

This chapter discusses the structure and composition of the Earth's atmosphere. The Earth's atmosphere is a reservoir of several gases. The gas molecules in this reservoir are continuously ...

Table of contents Structure of the atmosphere Composition of the atmosphere Table 1: Major components Table 2: Minor components Table 3: Trace components Ozone Carbon dioxide Energy ...

The composition of earth atmosphere

Imagine a layer cake, wrapping around the Earth. That is essentially what the Earth's atmosphere is like: layers upon layers of gas surrounding the Earth,

Earth's atmosphere composition Air is made up of a mixture of different gases. The principal constituents of Earth's atmosphere are: Nitrogen - about 78% of the atmosphere Oxygen - about 21% Argon - ...

From largest to smallest, Earth's atmosphere composition contains nitrogen, oxygen, argon, CO₂ and trace gases. Water vapor is excluded from this total.

Of this dry composition of the atmosphere nitrogen, by far, is the most common (78%). Nitrogen dilutes oxygen and prevents rapid or instantaneous burning at the Earth's surface, as oxygen gas is a ...

Origins of the Atmosphere When the Earth was formed 4.6 billion years ago, Earth's atmosphere was probably mostly hydrogen (H) and helium (He) plus hydrogen compounds, such as ...
