-----

About `__func__`: "The identifier `__func__` is implicitly declared by the translator as if, immediately following the opening brace of each function definition, the declaration: `static const char ...`

The difference is that `functionOne` is a function expression and so only defined when that line is reached, whereas `functionTwo` is a function declaration and is defined as soon as its ...

12 The `function*` type looks like it acts as a generator function for processes that can be iterated. C# has a feature like this using "yield return"; see 1 and see 2 Essentially this returns each ...

`(function(){})()`; Lastly, `!` makes the expression return a boolean based on the return value of the function. Usually, an immediately invoked function expression (IIFE) doesn't explicitly return ...

I have seen the use of `%>%` (percent greater than percent) function in some packages like `dplyr` and `rvest`. What does it mean? Is it a way to write closure blocks in R?

A function of that nature can be called at any time, anywhere. `jQuery` (a library built on Javascript) has built in functions that generally required the DOM to be fully rendered before being called.

`(function(doc){ doc.location = "/"; })(document);`//This is passed into the function above As for the other questions about the plugins: Type 1: This is not a actually a plugin, it's an object passed ...

509 It's all about variable scoping. Variables declared in the self executing function are, by default, only available to code within the self executing function. This allows code to be written without concern of ...
